                                                                                                                                                                                                                                                                                                                                                                                                                                    This software tool creates a fuzzy artmap neural network from a training image. It then writes the network data to a disk file that can be utilized by the classification module.
                                                                                                                                                                                                                                                                                                                                       ** ported to ANSI C and the AVS environment by Steven W. ```
this function returns the degree to which the input pattern is a fuzzy subset
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of the weight vector. The resulting vlaue is used to determine if resonance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and f2 is the index of the F2 node being examined. Mathematically speaking,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            for (refy = 0; refy < network->num_category[refx]+1; refy++)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pattern. The value of whichART determines which ART module is being queried
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    if(network->pattern[whichART][mfx]<network->dn[whichART][f2][mfx])
